

Installing Splunk on Win 11

These instructions are for installing Splunk on a single system.

Summary

This walkthrough involves installing Splunk on your Windows 11 VM. As previously mentioned, there are data ingestion limitations with the free Splunk instances. To overcome those issues we will install Splunk on the Windows 11 VM only and keep data ingestion disabled until we are ready to run our testing. After we run our testing, we will disable ingestion of logs into Splunk.

Install Splunk

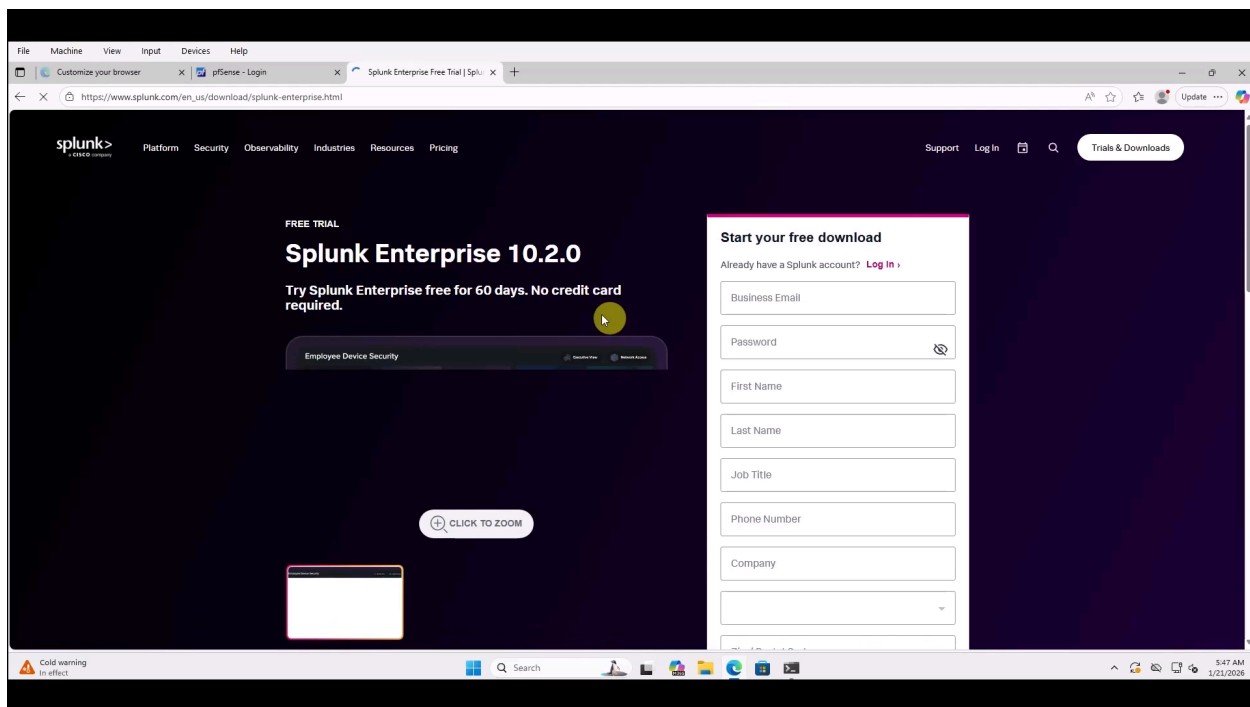

Signup for a free Splunk account at this link. You may need a business email (not gmail, yahoo, etc).

Free Splunk Trial | Download Splunk Enterprise Free for 60 Days | Splunk

Try Splunk Enterprise free for 60 days as a hybrid or on-prem download. Stream, collect and index any type of data safely and securely. No credit card required.

 https://www.splunk.com/en_us/download/splunk-enterprise.html

The Splunk logo, featuring the word "splunk" in a white, lowercase, sans-serif font, followed by a registered trademark symbol (®) and a greater-than sign (>). The logo is set against a background of overlapping orange and red geometric shapes.

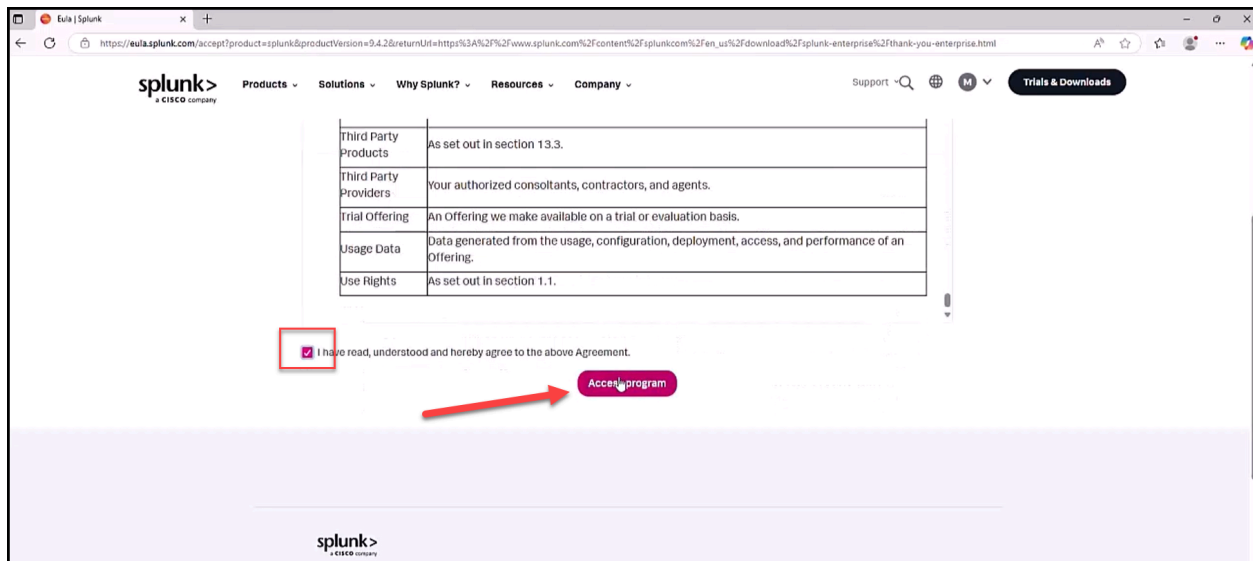

Set Up Splunk

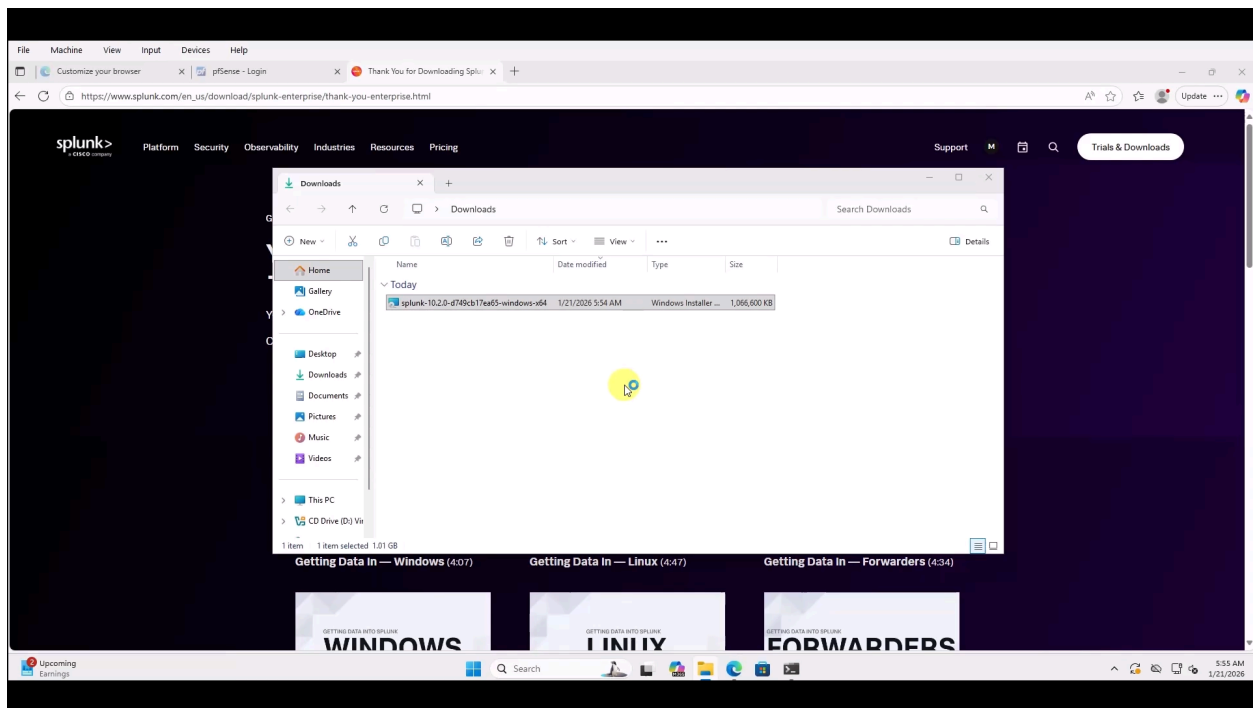

After you have created an account, from your Windows victim VM login, choose your download by selecting the Windows tab.

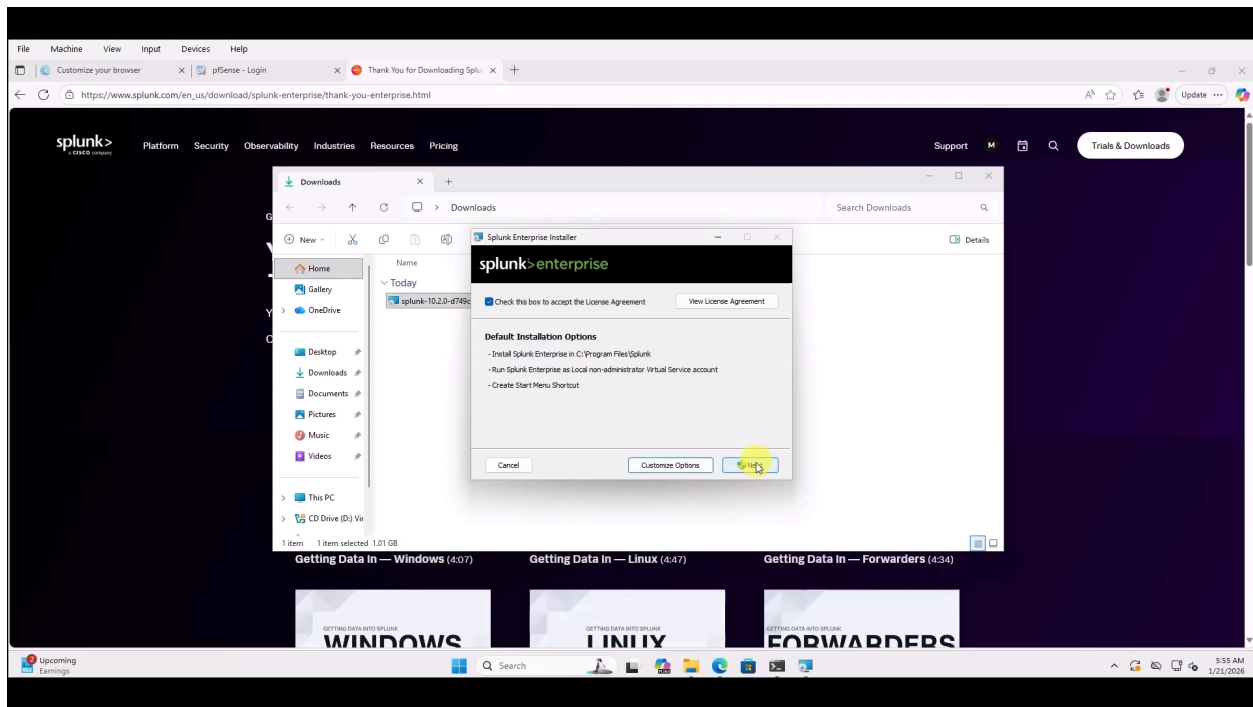

Accept the terms of agreement.

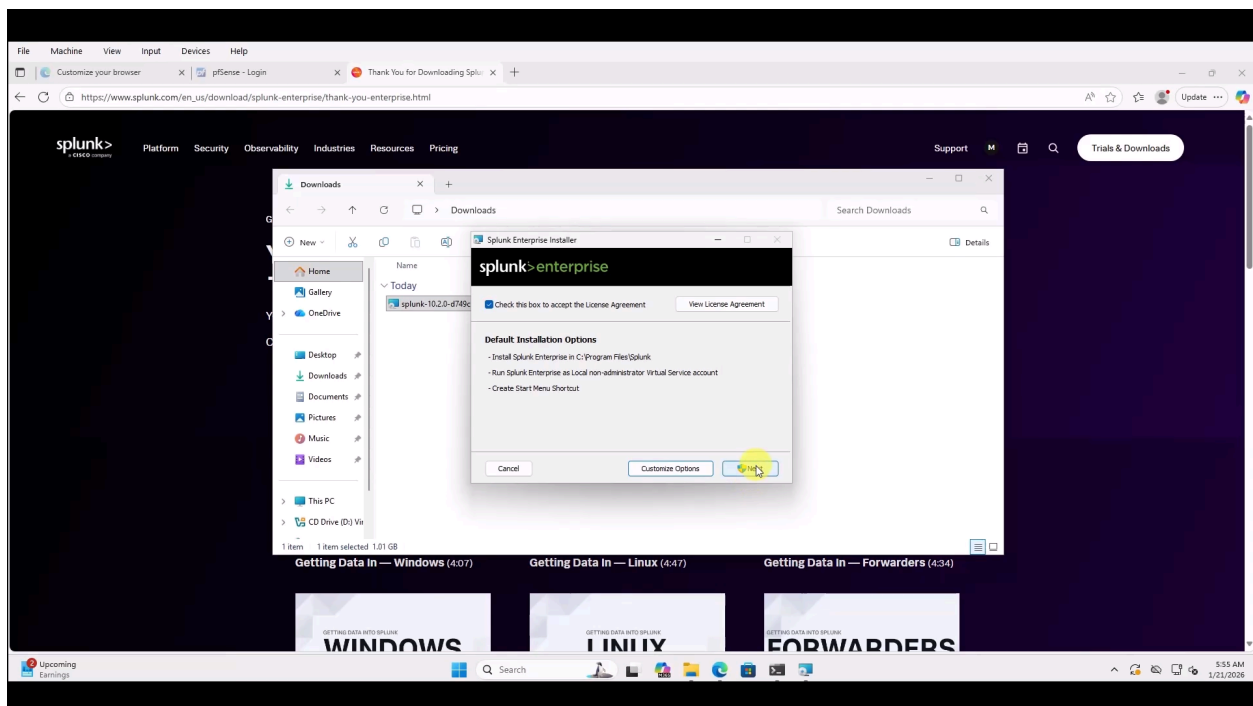

To install Splunk navigate to the directory you downloaded the file and simply double click the .msi file.

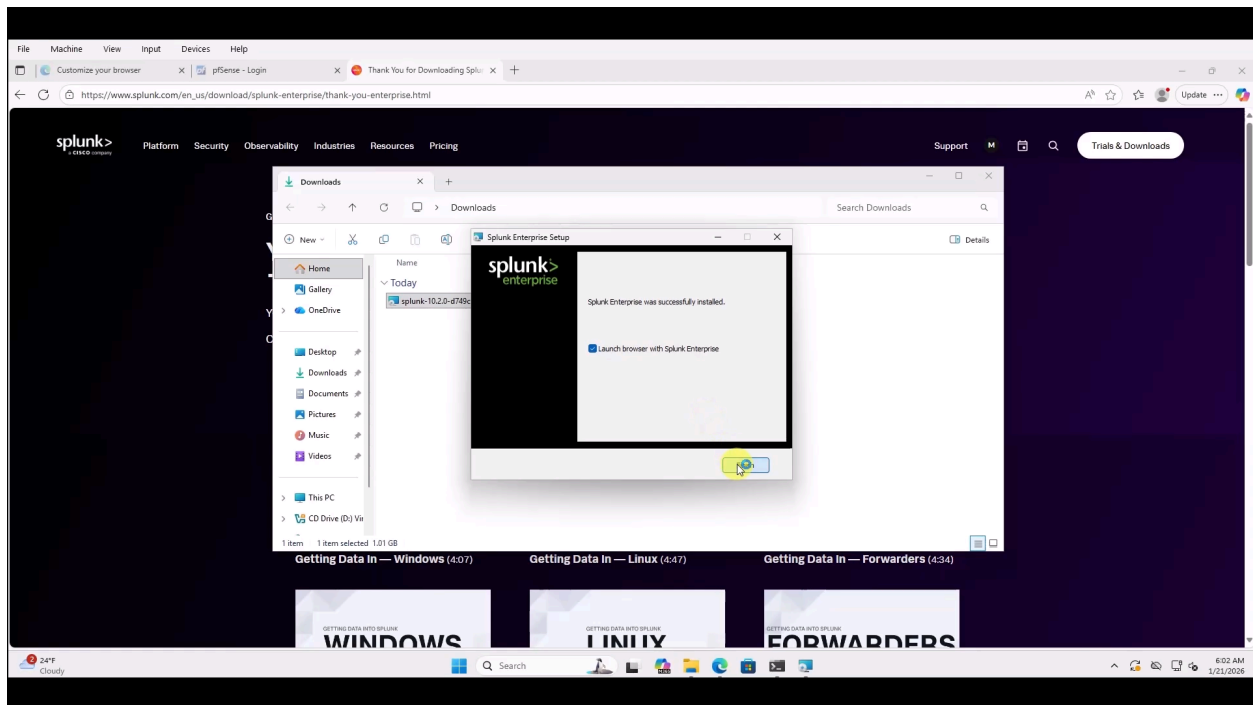

Accept license agreement.

Provide username and password.

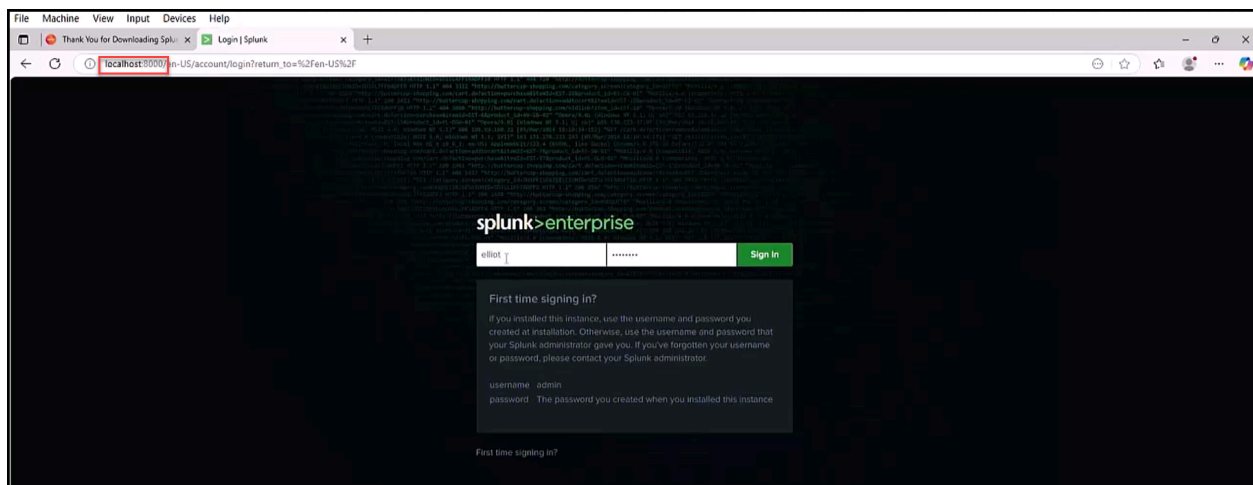

When completed launch Splunk.

If Splunk does not open up in the browser automatically, type the URL below and login with the credentials you created.

`localhost:8000`

Add Splunk Apps

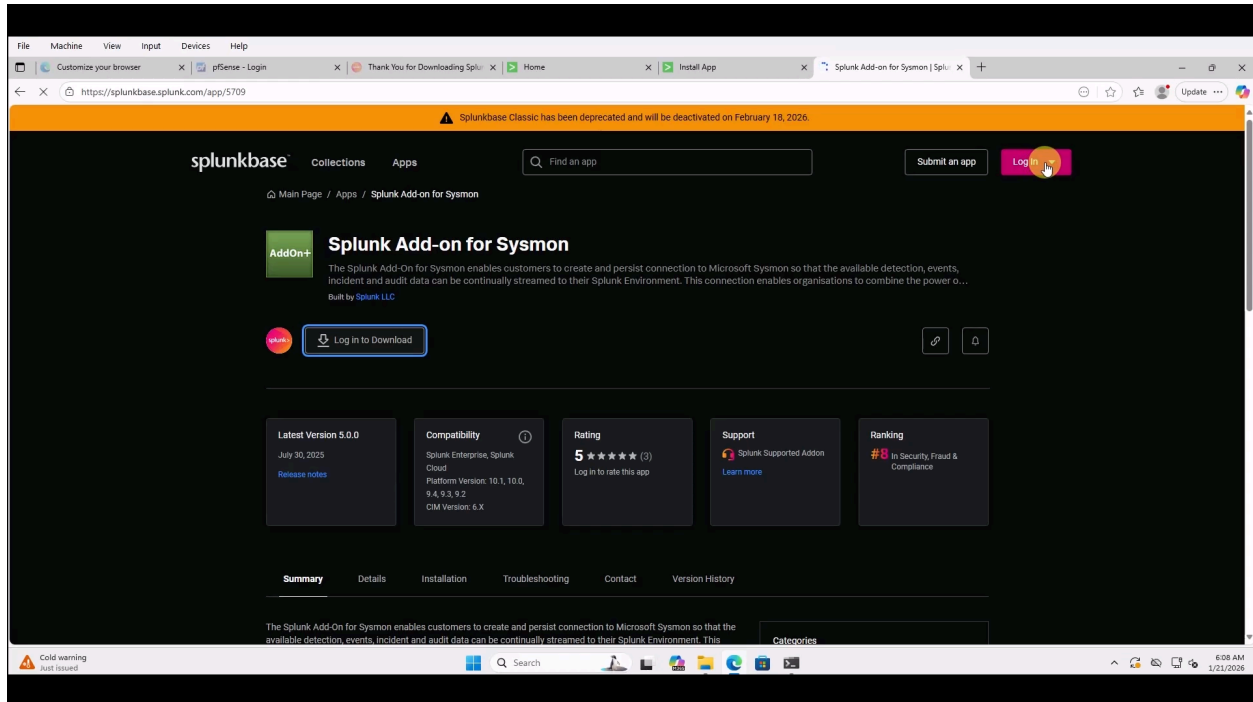

Navigate to the Sysmon app on Splunkbase at the link below.

Splunk Add-on for Sysmon | Splunkbase

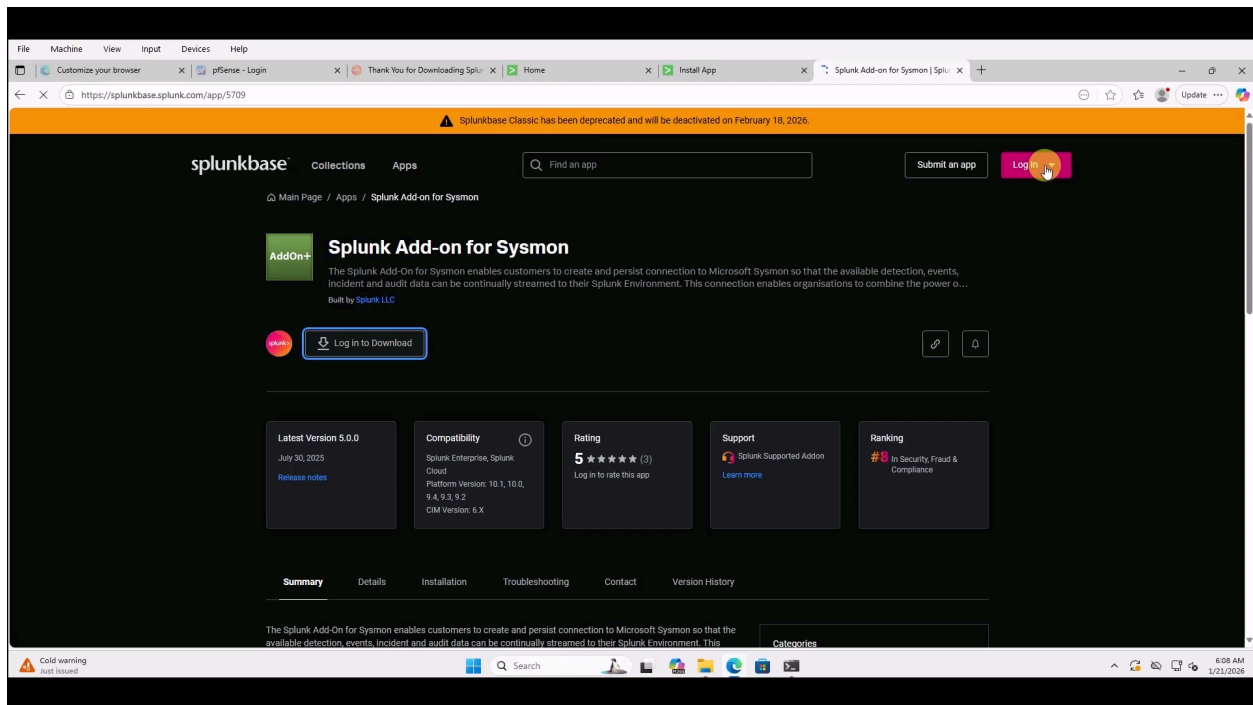

The Splunk Add-On for Sysmon enables customers to create and persist connection to Microsoft Sysmon so that the available detection, events, incident and audit data can be continually streamed to their Splunk Environment. This connection enables organisations to combine the power of the Splunk platform with the visibility and rich event data

 <https://splunkbase.splunk.com/app/5709>

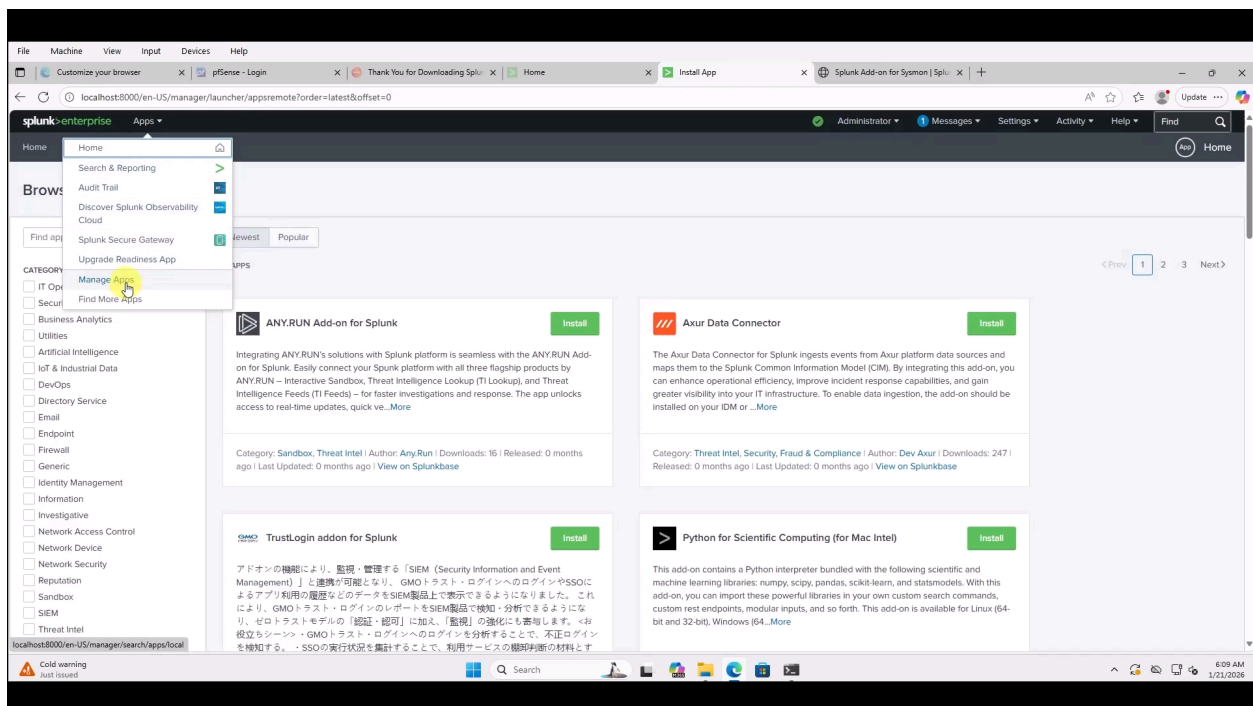

Login using your Splunk account, not the account you set up on this Splunk instance.

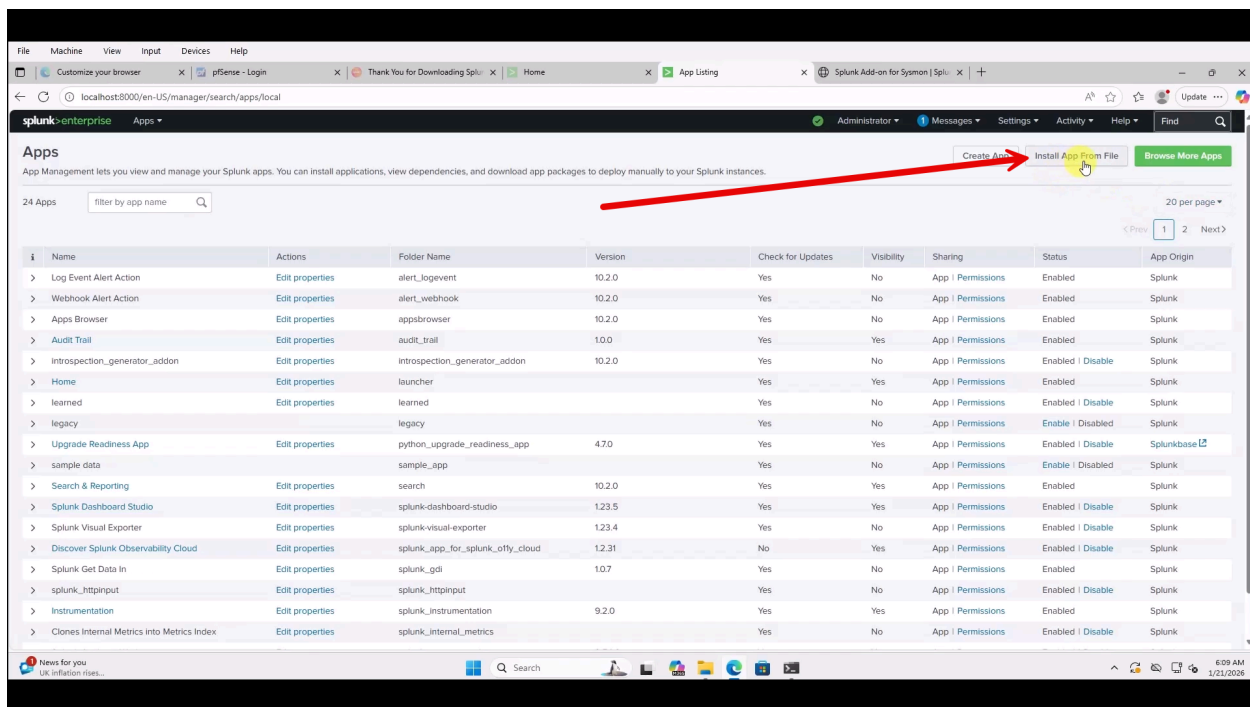

Select Download.

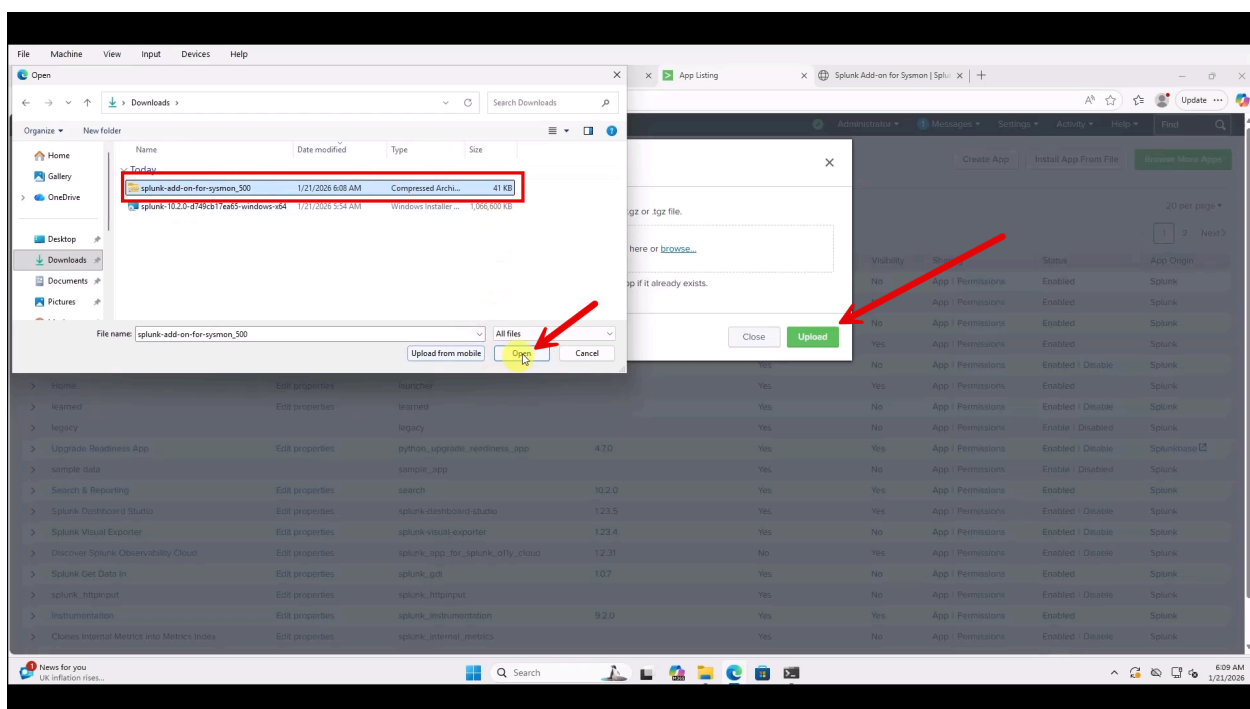

After downloading, go back to Splunk and go to Apps → Manage Apps

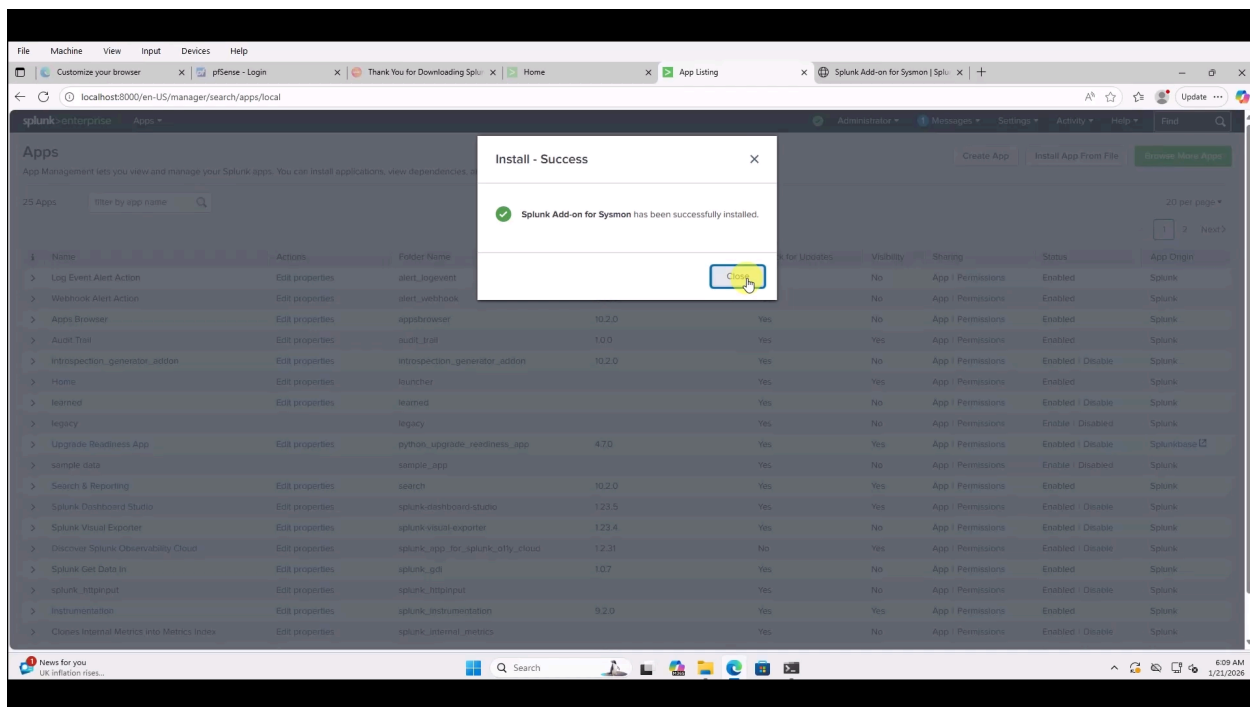

Select “Install App from File”

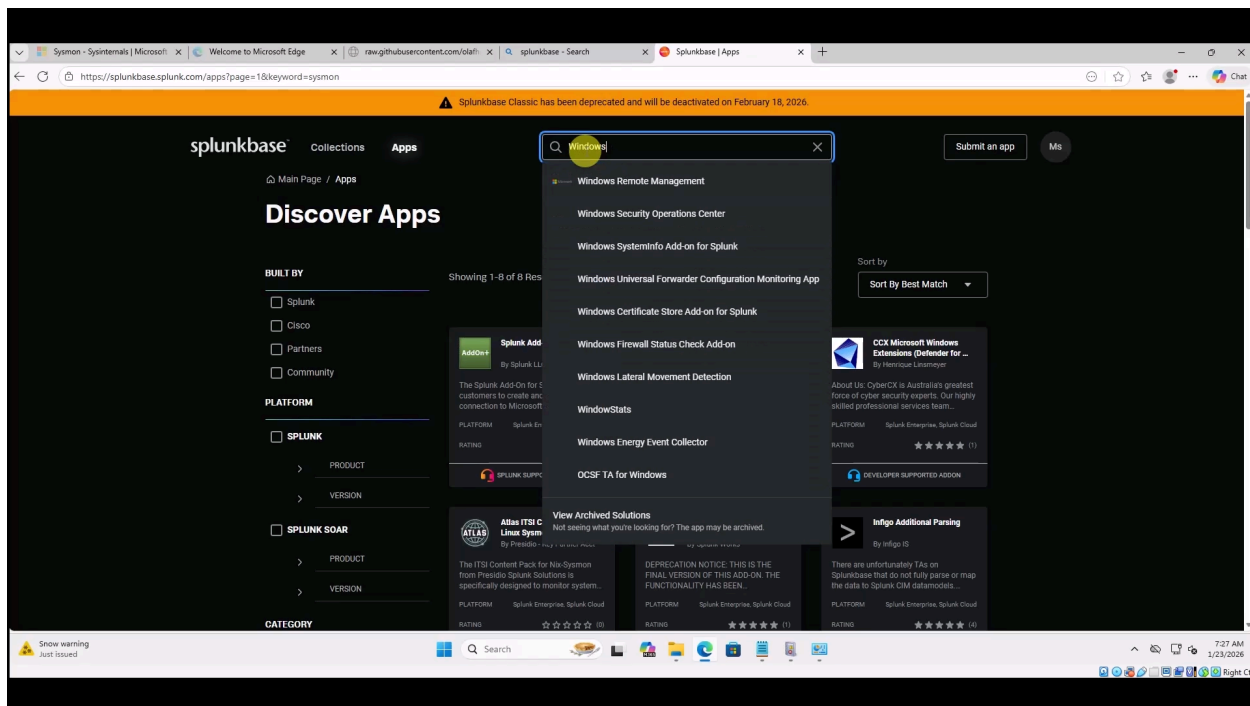

Select Upload and navigate to where you downloaded the app.

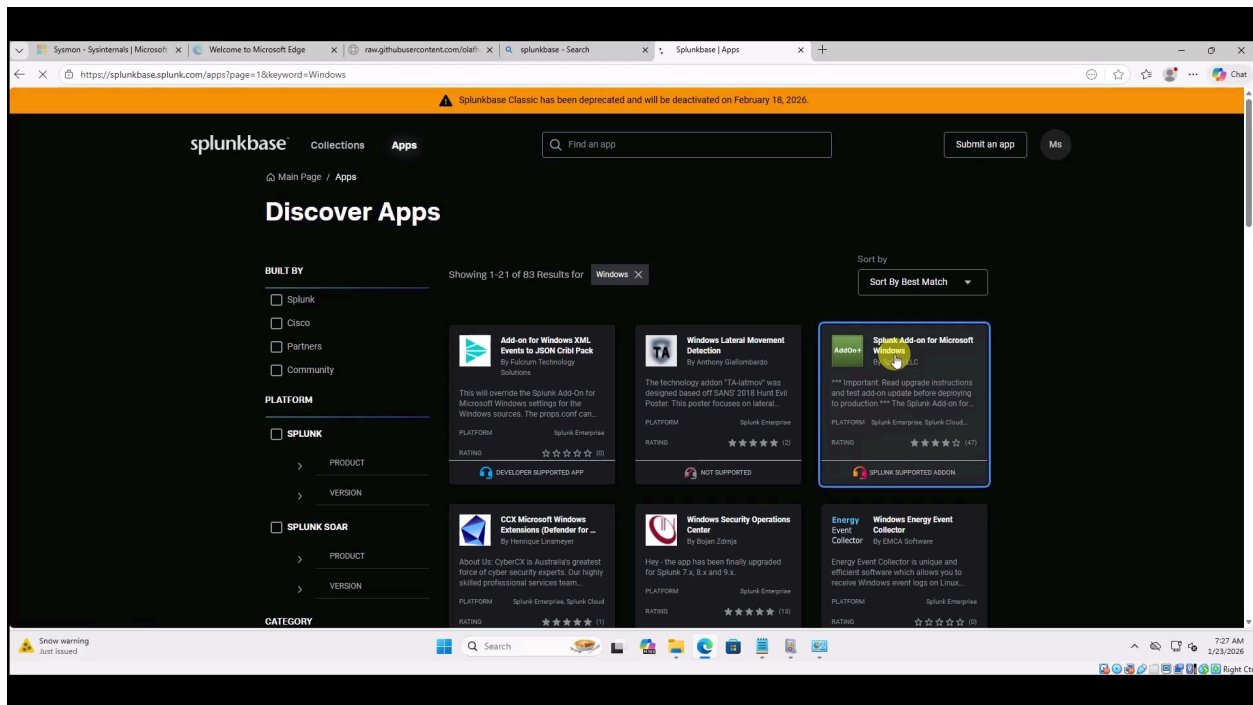

If successful, you should get a pop-up that says the install was successful.

To install the Splunk add-on for Windows, go back to Splunkbase and enter the work “Windows” in the search bar.

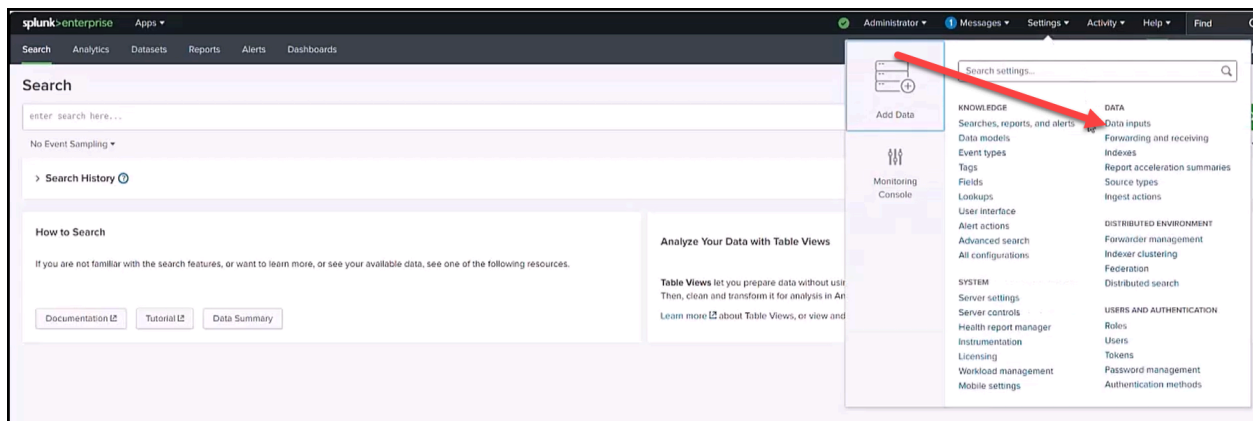

Choose Splunk Add-on for Microsoft Windows and download and install it the same way you did the Sysmon Add-on.

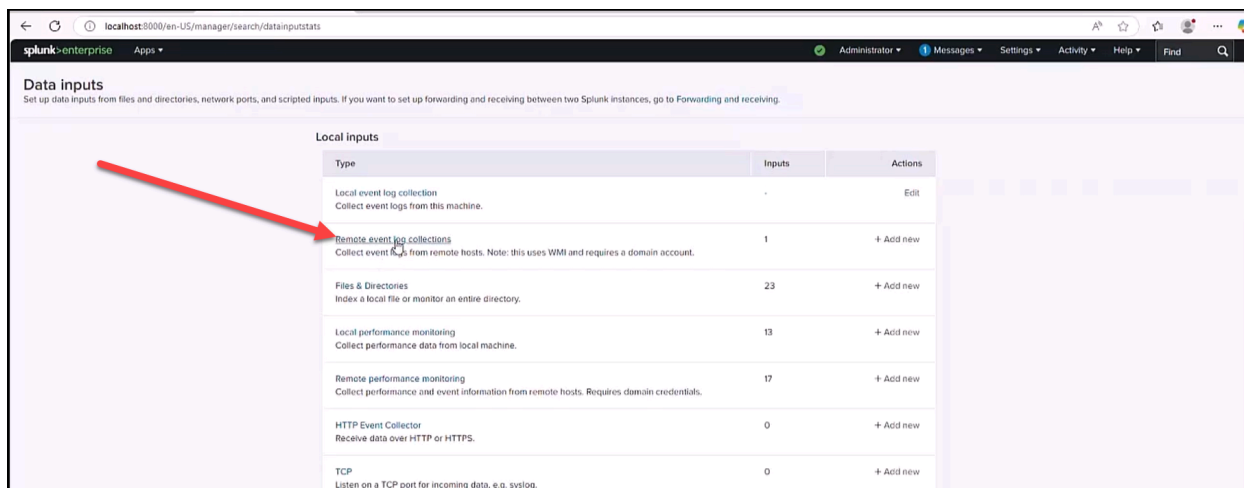

Set Up Data Inputs

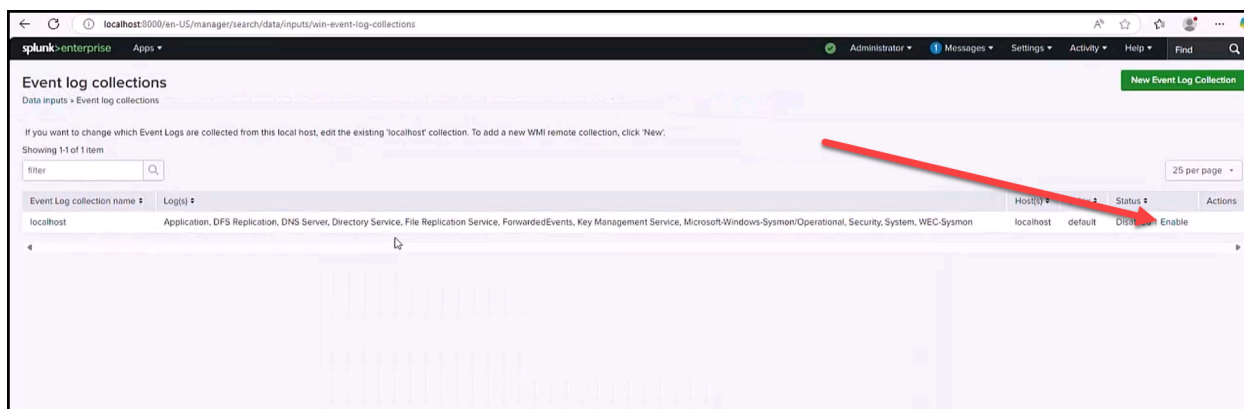

Select the Settings dropdown and the select "Data inputs" from the Data section.

Then select "Remote event log collections".

Enable the collection of the logs.

This is also the same way you will disable collection after you run the attack to ensure you do not surpass the data limitations with Splunk.

Test it by running ipconfig from the command line.

```
Microsoft Windows [Version 10.0.26100.4061]
(c) Microsoft Corporation. All rights reserved.

C:\Users\pprice>ipconfig

Windows IP Configuration

Ethernet adapter Ethernet:

    Connection-specific DNS Suffix  . : 
    Link-local IPv6 Address . . . . . : fe80::e896:d96f:f7bc:27da%13
    IPv4 Address. . . . . : 10.0.1.2
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 10.0.1.1

C:\Users\pprice>
```

Then go to Splunk Search and Reporting App and look for it. As seen below, one event was discovered.
